The present sequence is one of seventeen novel PRO polypeptides. The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating cardiovascular, endothelial or angiogenic disorders in a mammal. Examples of these disorders include cardiac hypertrophy, trauma, cancer, age-related macular degeneration, atherosclerosis, hypertension, arterial restenosis, Reynaud's disease, rheumatoid arthritis, amigna, myocardial infarctions, thrombophlebitis and lymphangitis. The PRO polypeptides and antagonists are also used to prevent tumour angiogenesis and for treating

are useful for increasing infiltration of inflammatory cells into a tissue of a mammal, stimulating or enhancing an immune is exponse, or increasing the proliferation of T-lymphocytes in a mammal in response to an artigen. Claimed compositions comprising a PRO polypeptide or its antagonist have the opposite effect. A claimed method for treating an immune related disorder, such as a T cell disorder, involves administering a PRO polypeptide, an agonist antibody or an antagonist antibody. The disorder is selected from systemic lupus erythematosus, rheumatoid arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthric pathy, systemic sclerosis, idiopathic inflammatory myopathy, Sjogren's syndrome, systemic vasculitis, sarcoidosis, autoimmune haemolytic anaemia, autoimmune tromatory chromosycopaenia, thyroiditis, diabetes mellitus, immune-mediated remained disease, demyelinated diseases (such as multiple sclerosis),

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          autoimmune chronic active hepatitis, primary biliary cirrhosis, granulomatous hepatitis, sclerosing cholangitis, inflammatory bowel disease (ulcerative colitis and Crohn's disease), gluten-sensitive
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               enteropathy, Whipple's disease, (auto)immune-mediated skin diseases (such as bullous skin disease, erythema multiforme and pooriasis), allergic diseases (such as asthma, allergic rhinitis, atopic dermatitis, food hypersensitivity and urticaria), immunologic diseases of the lung and transplantation associated diseases (such as graft rejection and graft-versus-host disease) (all claimed).
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         the level of expression of the PRO gene. Also claimed are a method of identifying a compound capable of inhibiting the expression or activity of the PRO polypeptide, vectors, host cells, antibodies, and a method of stimulating the proliferation of T lymphocytes
                                                                                                                                                                                                                                                                                                                                                                                                                         New PRO polypeptides, nucleic acids and (ant)agonists, useful for diagnosing and treating immune-related disorders, such as multiple sclerosis, rheumatoid arthritis and diabetes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            present sequence is that of novel human immunomodulator PRO364
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            (UNQ19), as deduced from cDNA (see AAF30057) isolated from a small intestine library. PRO364 (26 kDa, pI 6.34) shows sequence homology to mouse GITR protein and may be its human counterpart. The invention provides polynucleotides (see AAF30050-62) encoding novel human PRO proteins (see AAB20108-20) including PRO364.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      Claimed compositions comprising these proteins or their agonists are useful for increasing infiltration of inflammatory cells into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           1 QRPTGGPGCGPGRLLLGTGTDARCCRVHTTRCCRDYPGEECCSEWDCMCVQPEFHCGDPC

Composition for diagnosing and treating cardiovascular, endothelial and angiogenic disorders, comprises a PRO364 or PRO175 polypeptide -
                                                                                                                                                                                               PRO364; human; glucocorticoid-induced tumor necrosis factor; receptor; hGITR; ligand; hGITRL; PRO175; tumour necrosis factor receptor; TNFR; human umbilical vein endothelial cell; HUVEC; cardiac hypertrophy; myocardial infarction; PGF_2alpha; trauma; cancer; angiogenesis; age-related macular degeneration; antibody; periodontal disease; vascular-related drug targeting; atheroscierosis; hypertension; inflammatory vascularides; Reynaud's disease; aneurysm; arterial restenosis; thrombophlebitis; tumor angiogenesis;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    receptor (TWRR) family of polypeptides. The PROJTS cONA sequence was isolated from a library of CDNA fragments derived from human umbilical wein endothelial cells (HUVEC). Administering an effective amount of PRO364 or PROJTS or their antagonists is useful for treating cardiac hypertrophy (which is initiated by myocardial infarction and characterized by the presence of an elevated level of BGF_2alpha), trauma, a cancer, or age-related macular degeneration in a human. Administering a therapeutically effective amount of an antibody that binds PRO364 or PROJTS is useful for inhibiting angiogenesis induced by PRO364 or PROJTS in a human suffering from a tumor or a retinal disorder. PRO364 or PROJTS or their antagonists, are useful for
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  corticoid-induced tumor necrosis factor receptor (hGTRR). The corresponding ligand (hGTRRL), PR0175, is given in AAB47056. PR0364 and PR0175 may be used in a mixture with a cardiovascular, endothelial, angiogenic or angiostatic agent for the treatment of a cardiovascular, endothelial, anglogenic or angiostatic disorder. The PR0364 cDMs sequence was isolated from an expressed sequence tag (EST) database as having homology to members of the tumour necrosis factor
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               This sequence represents PRO364 polypeptide, which is a human gluco-
                                                                                                                                                                                                                                                                                                                                                                lung; liver; fibrosis; neuropathy; rheumatoid arthritis.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human; PRO; promotion; inhibition; angiogenesis; cardiovascularisation;
          The process sequence is that of a main included included the showing identity to murine glucocorticoid induced tumour necrosis factor receptor family related gene. The invention provides highly conserved TRI1, TRI1SVI and TRI1SV2 proteins (see AAY95879-81), as well as vectors, host cells and recombinant methods for their production. TRI1, TRI1SVI and/or TRI1SV2 polypeptides are useful for treating, preventing, prognosis and/or diagnosis of an immunodeficiency, especially common variable immunodeficiency, X-linked agammaglobulinemia, severe combined immunodeficiency (SCID), Wiskott-Aldrich syndrome or X-linked immunodeficiency antagonists (e.g. antibodies) are used to treat, prevent, prognose and/or diagnose an autoimmune disease, especially rheumatoid

The present invention describes nucleic acids encoding PRO polypeptides useful for preventing, diagnosing and treating diagnosing a cardiovascular, endothelial or angiogenic disorder in mammals by modulating cell proliferation, angiogenic disorder in mammals by and for identifying agonists and antagonists of these processes. The nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with inappropriate PRO expression such as cardiovascular, endothelial or angiogenic disorders in mammals (e.g. atherosciensis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCs) and vectors containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. AAA77510 to AAA77721 and associated with decreased PRO expression. AAA77510 to AAA77721 and the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                  ·,

clone, designated as DNA4736-1206. It is isolated from human small intestine tissue cDNA library, identified using probes based on the consensus sequence DNA41825, relative to the Incyte expressed sequence tag (BST) 3003460. This EST has homology to tumour necrosis factor receptor (INFR) family of polypeptides. PR0364 sequence also shows homology to members of the TNFR family and mouse GITR protein.

This clone is assigned the ATCC deposit No: 209436. PR0364 functions as a neoplastic cell growth inhibitor and is used for treating tumours, using an effective amount of PR0565, PR0364 and PR0344. This composition is especially useful for treatment of human cancers such as breast, prostate, colon, lung, renal, ovarian and CNS, leukemia and melanoma.
CNS; leukemia; melanoma; Expressed Sequence Tag; EST; TNFR homologue; tumour necrosis factor receptor; GITR protein homologue.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     The present sequence is the human PRO364 protein, encoded by the CDNA

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Gaps
                                                                                                                                      are useful for modulating apoptosis, NF-KB activation and proinflammatory or autoimmune responses in mammalian cells (claimed). Chimeric molecules comprising a PRO364 polypeptide fused to a heterologous sequence such as epitope tag or immunoglobulin Fc region are also claimed. PRO364 can be used in assays to identify other proteins or molecules involved in binding interactions. This is useful for identifying inhibitors or agonists of receptor/ligand binding. The PRO364 polypeptides may also be combined with an agent that is cytotoxic, chemotherapeutic or a growth inhibitor. PRO364 antibodies are useful in diagnostic inhibitors.
recombinant production of PRO364 polypeptides, e.g. in CHO, Escherichia coli or yeast host cells, are provided. Claimed polypeptides comperise amino acids 1.241, 1.x, 26-241 (i.e. the mature protein) and 26-X of the present sequence, where X is any one of amino acid respdies 157-167 of PRO364. PRO364 polypeptides
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           26 grptggpgcgpgrlllgtgtdarccrvhttrccrdypgeeccsewdcmcvqpefhcgdpc

                                                                                                                                                                          Novel PRO polypeptides and agonists and antagonists of them, used to diagnose and treat cardiovascular, endothelial and angiogenic disorders
                                                                                                                                                                                                                                                The present invention relates to methods for stimulating or inhibiting angiogenesis and cardiovascularization. The methods involve the use of pharmaceutical compositions based on the following proceins, PRO179, PRO818, PRO814, PRO816, PRO176, PRO205, PRO311, PRO313, PRO817, PRO819, PRO817, PRO819, PRO819, PRO882 or PRO887. These proteins were identified by isolating cDNA clones encoding secreted proteins. The proteins of the invention may be used to diagnose and treat cardiovascular, endothalial or angiogenic disorders. The present sequence is one of the proteins of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; immune related disease; diagnosis; antiinflammatory; cardiant; dermatological; antiarthritic; antirheumatic; immunosuppressive; haemostatic; antithyroid; antidiabetic; noctropic; neuroprofective; antianemic; hepatotropic; virucide; antipsoriatic; antiallergic; antiasthmatic; systemic lupus erythematosus; rheumatoid arthritis; osteoarthritis; spondyloarthropathy; systemic sclerosis; arrcoidosis; didopathic inflammatory myopathy; systemic sclerosis; arrcoidosis; systemic vasculitis; autoimmune haemolytic anaemia; diabetes mellitus; autoimmune thrombocytopaenia; immune-mediated renal disease; demyelinating disease; hepatobiliary disease; Whipple's disease; demyelinating disease; alutoimene disease; immune-mediated skin disease; allergic disease; immune-mediated skin disease; allergic disease; immunelogical disease; transplantation associated disease;

The present invention describes sixty four human PRO proteins which can be used in the treatment of immune related diseases. The human PRO proteins, anti-PRO antibodies, agonists and antagonists are useful for treating and diagnosing immune related disorders. The disorders are selected from systemic lupus erythematosus, rheumatoid arthritis, sosteoarthritis, juvenile chronic arthritis, spoodyloarthropathies, systemic solerosis, idiopathic inflammatory myopathies, Sjogren's syndrome, systemic vasculitis, sarcoidosis, autoimmune haemolytic
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sixty four PRO polypeptides, useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosis, rheumatoid arthritis, osteoarthritis, thyroiditis and diabetes mellitus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Henzel W;

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        The invention relates to novel human anglogenesis-associated proteins designated PRO proteins (AAB53064-B53097), and to nucleic acids encoding PRO proteins. The invention also relates to vectors and host cells comprising a PRO nucleic acid, the recombinant production of a PRO protein, agonists or antagonists of a PRO protein, agonists or antagonists of a PRO protein, and comprising a PRO protein, agonists or antagonists of a PRO protein, and comprising a PRO protein, agonists or antagonists of a PRO protein, and additionally encompasses methods of identifying modulators of PRO additionally encompasses methods of identifying modulators of PRO additionally encompasses methods of identifying modulators of PRO anglogenic disorder to a susceptibility to such a disorder by detecting mutations in a PRO gene, or the expression level of a PRO gene within a particular tissue, treating a cardiovascular, endothelial or angiogenic disorder via the administration of a PRO protein, PRO nucleic acid, or PRO angonist can antagonist; a retroviral gene therapy vector comprising a PRO nucleic acid; and methods of inhibiting or stimulating endothelial or angonist or antagonist thereof. PRO nucleic acids, PRO proteins, and methods of inhibiting or stimulating endothelial or angonist or antagonist thereof. PRO nucleic acids, PRO proteins, antibodies against PRO proteins, PRO agonists and PRO antagonists may be used as therapeutic agents to treat catherosclerosis, osteoporosis, myocardial infarction, hypertension, disease, psoriasis, and issue an ilbraries to isolate constant and acids are additionally useful in the recombinant production of PRO proteins, as hybridisation probes to scending PRO nucleic acids are additionally useful in the cecombinant production of PRO proteins, to analyse genetic disorders, and in an angonist and pense encoding PRO proteins, to analyse genetic disorders, and in an and in gene therapp. PRO nucleic acids are also be used to produce transgenic animals useful for the development and screening of potential
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     KP, Ferrara N, Gerber H, Goddard A;

protein from crone_A8. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antigen-specific proliferation and cytokine production by T-cells, and potentiates T cell axpansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal poliferation, e.g. cancertous conditions or degenerative conditions. They can be used in the regulation or development of haematopoietic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.
This is the amino acid sequence of the truncated human 312C2 T cell

                                                                     This sequence represents PRO364 polypeptide, which is a human glucocorticoid-induced tumor necrosis factor receptor (hGITR). The cortesponding ligand (hGITRL), PRO175, is gluen in AAB47056.

RO364 and PRO175 may be used in a mixture with a cardiovascular, endothelial, angiogenic or angiostatic agent for the treatment of a cardiovascular, endothelial, angiogenic or angiostatic disorder. The RO364 cDNA sequence was isolated from an expressed sequence tag (EST) database as having homology to members of the tumour necrosis factor receptor (TNRR) family of polypeptides. The PRO175 cDNA sequence was isolated from a library of cDNA fragments derived from human umbilical cells (HUVEC). Administering ne effective amount of RO364 or PRO175 or their antagonists is useful for treating cardiac characterized by the presence of an elevated level of PGE_2alpha), trauma, a cancer, or age-related macular degeneration in a human. Characterized by the presence of an elevated level of PGE_2alpha), trauma, a cancer, or age-related macular degeneration in a human. Characterized by RO364 or PRO175 is useful for inhibiting angiogenesis induced by PRO364 or PRO175 is useful for inhibiting angiogenesis induced by PRO364 or PRO175 is useful for inhibiting angiogenesis induced by PRO364 or PRO175 is useful for inhibiting angiogenesis induced vascular-related drug targeting or as therapeutic targets for the treatment or prevention of atherosclerosis, hypertension, inflammatory vasculitides, Reynaudy andiogenesis arterial restenses; a recention of the protection of a theorypeans and the protection or a retinal vascular-related drug targeting or as therapeutic targets for the thrombothlebities and protection or a retinal angenty angiogenesis and protection or a retinal vascular-related drug targeting or as therapeutic targets for the transfer and protection or a retinal angentic preserved to a retinal angentic protection or a retinal angentic pr
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           Composition for diagnosing and treating cardiovascular, endothelial and angiogenic disorders, comprises a PRO364 or PRO175 polypeptide -
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           thrombophlebitis, tumor angiogenesis, gut protection or regeneration and treatment of lung or liver fibrosis, periodontal diseases, attraction of bone-forming cells, central and peripheral nervous system disease and neuropathies and rheumatoid arthritis.

The PRO nucleic acids, polypeptides, agonists and antagonists are useful for treating cardiovascular, endothelial or andiogenic disorders in a mammal. Examples of these disorders include cardiac hypertrophy, trauma, cancer, age related macular degeneration, atherosclerosis, hypertension, arterial restenosis, Reynaud's disease, rheumatoid arthritis, angina, myocardial infarctions, thrombophlebitis and lymphangitis. The PRO polypeptides and antagonists are also used to prevent tumour angiogenesis and for treating periodontal diseases. They are also used to stimulate wound healing and tissue regeneration. The PRO nucleic acids, polypeptides and anti-PRO antibodies are useful for diagnosing a cardiovascular, endothelial or angiogenic disorder.
                                                                                                                                                                             SA;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human; angiogenesis-associated protein; PRO; endothelial cell growth; cardiac hypertrophy; cardiovascular disorder; endothelial disorder; angiogenic disorder; atherosclerosis; osteoprosis; hypertension; mycardial infarction; diabetic retinopathy; rheumatoid arthritis; Crohn's disease; psoriasis; endometriosis; ulcer; wound healing; cancalianer's disease; Huntington's disease; stroke; drug screening;

                                                                                                                                                                                                                                                                                                                                                                                                                                PRO364; DNA47365-1206; human; ATCC No: 209436; antiproliferative; neoplastic cell growth inhibitor; cytostatic; treatment; cancer; tumour; breast; prostate; colon; lung; renal; ovarian; central nervous system; CNS; leukemia; melanoma; Expressed Sequence Tag; EST; TNFR homologue; tumour necrosis factor receptor; GITR protein homologue.
                                      inappropriate PRO expression such as cardiovascular, endothelial or anglogenic disorders in mammals (e.g. atherosclerosis, cancers and cardiac hypertrophy). For example, the nucleic acids (NCs) and vectors containing them and the PRO polypeptide may be used to treat disorders associated with decreased PRO expression. AAA77510 to AAA77721 and AAB24388 to AAB24435 represent nucleotide and protein sequences used in the exemplification of the present invention.
modulating cell proliferation, angiogenesis and cardiovascularisation, and for identifying agonists and antagonists of these processes. The nucleic acids and the proteins they encode may be used in the prevention, treatment and diagnosis of diseases associated with

clone, designated as DNA4736-1206. It is isolated from human small intestine tissue CDNA library, identified using probes based on the consensus sequence DNA4736-1206. It is isolated from human small consensus sequence DNA4825, relative to the Incyte expressed sequence tag (EST) 3003460. This EST has homology to tumour necrosis factor receptor (TNRR) family of polypeptides. PRO364 sequence also shows homology to members of the TNRR family and mouse GIRR protein.

This clone is assigned the ATCC deposit No: 209436. PRO364 functions as a neoplastic cell growth inhibitor and is used for treating tumours, using an effective amount of PRO565, PRO364 and PRO344. This composition is especially useful for treatment of human cancers such as breast, prostate, colon, lung, renal, ovarian and CNS, leukemia and melanoma.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  YPGEECCSEWDCMCVQPEFHCGDPCCTTCRHHPCPPGQGVQSQGKFSFGFQCIDCASGTF 120

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present sequence is that of novel human immunomodulator PRO364 (UND19), as deduced from CDNA (see AAF30057) isolated from a small intestine library. PRO364 (26 kDa, pt 6.34) shows sequence homology to mouse GITR protein and may be its human counterpart. The invention provides polynucleotides (see AAF30050-62) encoding novel human PRO proteins (see AAB70108-20) including PRO364. Claimed compositions comprising these proteins or their agonists are useful for increasing infiltration of inflammatory cells into
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        /note= "prokaryotic membrane lipoprotein lipid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              /note= "leucine zipper pattern"
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Goddard A,

a classic of a manimal, Stimulating of enimatoria of a classic of a mamimal, Stimulating of enimatoria of an antigen. Claimed compositions comprising a PRO polypeptide or its antagonist have the opposite effect. A claimed method for treating an immune related disorder, such as a T cell disorder, involves administering a PRO polypeptide, an agonist antibody or an antagonist antibody. The disorder is selected from systemic lupus erythematosus, rheumatoria arthritis, osteoarthritis, juvenile chronic arthritis, spondyloarthropathy, systemic sclerosis, juvenile chronic arthritis, autoimnume haemolytic anaemia, autoimnume chrombocytopaenia, thyroidiis, diabetes mellitus, immune-mediated renal disease, demyellnated diseases (such as multiple sclerosis), autoimnume chronic active hepatitis, primary billary cirrhosis, cartoimnume chronic active hepatitis, primary billary cirrhosis, cartoimnume chronic active hepatitis, primary billary cirrhosis, cartoimnume chronic active hepatitis, primary billary cirrhosis, cartoinnume chronic active hepatitis, solenosing cholangitis, inflammatory bowel disease (ulcerative colitis and Crohn's disease), gluten-sensitive circh as bullous skin disease, (auto)immune-mediated skin diseases (such as bullous skin disease, erythema multiforme and psoriasis), allergic diseases (such as asthma, allergic rhinitis, atopic dermaitits, food hypersensitivity and urticaria), immunologic claimed methods of diagnosing these disorders comprise detecting the lung and transplantation associated diseases (such as graft rejection and graft-versus-host disease) (all claimed are a method of identifying a compound capable of inhibiting the expression or activity of the PRO polypeptide, vectors, host cells, antibodies, and a method of stimulating the proliferation of T lymphocytes
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       PRO364; human; glucocorticoid-induced tumor necrosis factor; receptor; human unbilical vein endothelial cell; HUVEC; cardiac hypertrophy; human unbilical vein endothelial cell; HUVEC; cardiac hypertrophy; myocardial infarction; PGF_2alpha; trauma; cancer; angiogenesis; age-related macular degeneration; antibody; periodontal disease; vascular-related drug targeting; atheroscierosis; hypertension; inflammatory vasculitides; Reynaud's disease; aneurysm; arterial restenosis; thrombophlebitis; tumor angiogenesis; lung; liver; fibrosis; neuropathy; rheumatoid arthritis.

be used in the treatment of immune related diseases. The human PRO
proteins, anti-PRO antibodies, agonists and antagonists are useful for
treating and diagnosing immune related diseases. The human PRO
proteins, anti-PRO antibodies, agonists and antagonists are useful for
treating and diagnosing immune related disorders. The disorders are
calcuted from systemic lupus erthritis, rheumatorid arthritis,
systemic sclerosis, idopathic inflammatory myopathies, Sjogren's
systemic sclerosis, idopathic inflammatory myopathies, Sjogren's
systemic sclerosis, idopathic inflammatory myopathies, Sjogren's
systemic vasculitis, sarcoldosis, autoimmune haemolytic
anaemia, autoimmune thrombocytopaenia, thyroiditis, diabetes mellitus,
immune-mediated renal disease, demyelinating diseases of inflammatory
bowel disease, gluten-sensitive enteropethy and Whipple's disease,
autoimmune or immune-mediated skin diseases, allergic diseases,
including graft rejection and graft-versus-host-disease.
AACS8379 to AACS8378 represent PCR primers and hybridisation probes used
in the isolation of human PRO sequences, AACS8679 to AACS8642 and
AACS8371 to AACS8678 represent human PRO polynucleotide and protein
sequences given in the exemplification of the present invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Sixty four PRO polypeptides, useful in the diagnosis and treatment of immune related disorders, e.g. systemic lupus erythematosis, rheumatoid arthritis, osteoarthritis, thyroiditis and diabetes mellitus
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    The present invention describes sixty four human PRO proteins which can

The present sequence is that of human tumour necrosis factor receptor-like protein TR11 (see also AAY95879), a novel protein showing identity to murine glucocorticoid induced tumour necrosis factor receptor family-related gene. The invention provides highly conserved TR11, TR11SV1 and TR11SV2 proteins (see AAY95879-81), as well as vectors, host cells and recombinant methods for their production. TR11, TR11SV1 and/or TR11SV2 polypeptides are useful for treating, preventing, prognosis and/or diagnosis of an immunodeficiency, sepecially common variable immunodeficiency, (SCID), Wiskott-Aidrich syndrome or X-linked immunodeficiency deficiency with hyper IgM. TR11SV1 and/or TR11SV1 and/or TR11SV2 and/or diagnose an autoimmune disease especially rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Human tumor necrosis factor receptor-like proteins useful for diagnosis, prevention and treatment of disease states associated with aberrant cell survival such as autoimmune disease and rheumatoid
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        arthritis systemic lupus erythematosus, thrombocytopenia purpura or iga nephropathy. The polypeptides, polynucleotides and/or antibodies can be administered to cells in vitro, ex vivo or in vivo or to a multicellular organism. Soluble forms of the

                                                                                                                                                This is the amino acid sequence of the human tumour necrosis factor receptor-like protein (TRII receptor). The invention relates to TRII and two splice variants TRISVI and TRISVI. The nuclectide sequences were determined by sequencing cloned consa A237765 237766. The TRII receptor induced tumour necrosis factor receptor family related gene (GITR). TRIISVI and TRIISV2 polypeptides may be involved in the regulation of cell-type specific receptor-mediated cell growth, differentiation, and ultimately cell death. They can be used for screening for and ultimately cell death. They can be used for screening for sourists and alsease state associated with aberrant cell agonists and sleases state associated with aberrant cell survival. They can be used for treating immunodeficiency disorders, bigeorge syndrome, HIV infection, severe combined immunodeficiency consurvival. They can be used for treating immunodeficiency disorders, blood cagulation disorders, blood platelet disorders or wounds resulting from traume or surgery. They can also be used to treat heart attacks, strokes, Addison's disease, heart attacks, strokes, Addison's disease, and liple sclerosis, mysathenia gravis, Stiff-Man syndrome, systemic lupus erythematosus, Gullain-Barre syndrome, insulin dependent disperses maltiple sclerosis, mysathenia gravis, Stiff-Man syndrome, infury, complement-mediated molecule, organ rejection or graft versus host disease, inflammatory conditions, ischaemia-reperfusion infury, changed to repeti, replace, or protect tissue demaged by congenital chemokine induced lung injury, inflammatory bowel disease, Conditions. They can also be used to repeti, replace, or protect tissue demaged by congenital eryclasses, gravier, intouchas, and some central nervous system disease, amyctrophic lateral eryclasses, emperention, disease, amyctrophic lateral

This is the amino acid sequence encoding the human 312C2 T cell protein. The 312C2 proteins are expressed in thymus cells and are induced on T cells and spleen cells following activation. Engagement of 312C2 stimulates proliferation of T cell clones, antigen-specific proliferation and cytokine production by T-cells, and potentiates T cell-expansion or apoptosis. The products can be used in the treatment of conditions associated with abnormal physiology or development, including abnormal proliferation, e.g. cancerous conditions or degenerative conditions. They can be used in the regulation or development of haematopoietic cells, e.g. lymphoid cells which affect immunological responses, e.g. autoimmune disorders.
Human 312C2 T cell protein; thymus cell; spleen cell; T cell;
antigén-specific T cell prolifération; cytokine production by T-cell;
apoptosis; cancer; heamatopoietic cells; lymphoid cell;

The present sequence represents human PRO364, a novel member of the tumour necrosis factor receptor family. The sequence was deduced from a bone marrow cDNA clone (see AAX87670). Methods for the recombinant production of PRO364 polypeptides, e.g. in CHO, Escherichia coll or yeast host cells, are provided. Claimed polypeptides comprise amino acids 1-241, 1-X, 26-241 (i.e. the mature protein) and 26-X of the present sequence, where X is any one of amino acid respides 175-167 of PRO364. PRO364 polypeptides profile in acid and acid sessions sequence, where X is any one of amino acid respides 157-167 of PRO364. PRO364 polypeptides profile immanian and profine in mammalian cells
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         claimed). Chimeric molecules comprising a PRO364 polypeptide fused to a heterologous sequence such as epitope tag or immunoglobulin For region are also claimed. PRO364 can be used in assays to identify other proteins or molecules involved in binding interactions. This is useful for identifying inhibitors or agonists of receptor/ligand binding. The PRO364 polypeptides may also be combined with an agent that is cytotoxic, chemotherapeutic or a growth inhibitor. PRO364 antibodies are useful in diagnostic methods, purification methods and also in therapy, e.g. as

The present sequence is that of human tumour necrosis factor receptor-like protein TRII, a novel 25 kDa protein which shows 58.6% identity to murine glucocorticoid induced tumour necrosis factor receptor family related gene. The sequence was deduced from a cDMA clone (see AAA50304) discovered in a T-helper cell library.

TRII activated NF-kappaB through a TRAF2-mediated mechanism. Expressed in activation-inducible. The TRII ligand is constitutively cappressed in an endothelial cell line. This suggests that TRII and its ligand may be involved in activated T-cell trafficking.

The invention provides TRII, TRIISVI and TRIISV2 nucleic acids (see AAA50304-06) and highly conserved encoded proteins (see AAA50304-06) and highly conserved encoded proteins (see AAA50304-06) and highly conserved encoded proteins (see CAAY5879-81), as well as vectors, host cells and recombinant methods for their production. TRII, TRIISVI and/or TRIISV2 polypeptides are useful for treating, preventing, prognosis and/or diagnosis of an
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  Human tumor necrosis factor receptor-like proteins useful for diagnosis, prevention and treatment of disease states associated with aberrant cell survival such as autoimmune disease and rheumatoid

; Sequence 4, Application US/08911423
; Patent No. 611090
; GENERAL INFORMATION:
   APPLICANT: Gorman, Daniel M.
   APPLICANT: Randal, Troy D.
   APPLICANT: Albert
   TITLE OF INVENTION: MAMMALIAN CELL SURFACE ANTIGENS; RELATED
   TITLE OF INVENTION: REAGENTS
   NUMBER OF SEQUENCES: 8
   CORRESPONDENCE ADDRESS:
   ADDRESSEE: DNAX Research Institute
   STREET: 901 California Avenue
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  CUDNIER: USA

CUDNIER: USA

COMPUTER READABLE FORM:
MEDIUM TYPE: Floppy disk

COMPUTER: IBM PC COMPATIBLE
OPERATING SYSTEM: PC-DOS/MS-DOS
SOFTWARE: Patentin Release #1.0, Version #1.30

CURRENT APPLICATION DATA:
APPLICATION NUMBER: US/08/911,423

FILING DATE: 14-AUG-1997

CLASSIFICATION: 536

PRIOR APPLICATION DATA:
APPLICATION NUMBER: US 60/023,419

FILING DATE: 16-AUG-1996

PRIOR APPLICATION DATA:
APPLICATION NUMBER: US 60/027,901

FILING DATE: 07-OCT-1996

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.
                                                                                                                                               ; Search time 65.86 Seconds
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            Sequence 191,

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     Pred. No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed and is derived by analysis of the total score distribution.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      sequence 7, sequence 11, sequence 11, sequence 11, sequence 9, sequence 2, sequence 2, sequence 52, sequence 51, sequence 51, sequence 2, sequence 51, sequence 2, sequence 2,
